

MINI-ASSESSMENT

Multi-Step Prompt Workflow – AI Content Creation & Quality Assurance

Name: MARUSU LAVANYA

Regd No: 99230040134

1. Objective

The objective of this workflow is to design a multi-step Generative AI prompt workflow that converts a user's content idea into a high-quality, audience-specific, reviewed, and professionally formatted piece of content.

The workflow uses prompt chaining, structured prompting, content refinement, quality validation, and iterative improvement.

2. Workflow Overview

3. Detailed Workflow Steps

Step 1 – Understand Content Requirements

Purpose

The first step analyzes the user's content idea and identifies the requirements needed to create appropriate content.

Prompt

You are an AI Content Planning Assistant.

Analyze the user's content request and identify:

1. The main content objective
2. Target audience
3. Desired tone and writing style
4. Key topics that should be covered
5. Expected content format
6. Approximate length
7. Important constraints or requirements

Identify any ambiguity or missing information.

Do not write the final content at this stage.

Return the result using clear headings and bullet points.

Output

A structured content requirement specification.

4. Step 2 – Create Content Outline

Purpose

This step converts the requirements into a logical structure before generating the actual content.

Prompt

Using the content requirements from Step 1, create a detailed content outline.

The outline should:

- Have a clear introduction
- Organize the main ideas logically
- Include relevant supporting points
- Include examples where appropriate
- End with a suitable conclusion or call to action
- Match the target audience and requested tone

Do not generate the complete content yet.

Return the outline using numbered headings and subheadings.

Output

A structured content outline.

5. Step 3 – Generate First Draft

Purpose

This step generates the initial version of the content using the approved requirements and outline.

Prompt

Using the requirements from Step 1 and the outline from Step 2, generate the first draft of the requested content.

Requirements:

- Follow the approved outline.
- Match the intended target audience.
- Maintain the requested tone and style.
- Use clear and natural language.
- Include relevant examples where appropriate.
- Avoid unnecessary repetition.
- Do not introduce information that is unrelated to the user's objective.

Produce a complete first draft.

Output

A complete first draft.

6. Step 4 – Review and Improve

Purpose

This step acts as an AI editor and identifies weaknesses in the first draft.

Prompt

Act as a professional content editor.

Review the first draft against the requirements and outline from the previous steps.

Check for:

1. Clarity
2. Relevance
3. Grammar and language quality

4. Logical flow
5. Repetition
6. Missing important points
7. Inappropriate tone
8. Unsupported or questionable claims
9. Audience suitability
10. Formatting problems

For every significant issue, provide:

Issue:

Why it matters:

Recommended improvement:

Then provide a prioritized list of corrections.

Do not produce the final version yet.

Output

An editorial review containing identified issues and recommended corrections.

7. Step 5 – Finalize Content

Purpose

This step applies the review feedback and generates the polished final version.

Prompt

Using the original requirements, content outline, first draft, and editorial review, create the final polished content.

Apply all relevant corrections identified during the review.

Requirements:

- Preserve the original objective.
- Maintain the appropriate target audience and tone.
- Improve clarity and logical flow.
- Remove unnecessary repetition.
- Correct grammar and wording.
- Ensure all major points from the outline are covered.
- Avoid unsupported claims.
- Use professional formatting.

Return only the final polished content.

Output

A final, polished content piece.

8. Step 6 – Quality Evaluation

Purpose

This step evaluates whether the final content meets the required quality standards.

Prompt

Evaluate the final content against the original requirements.

Score each criterion from 1 to 5:

1. Relevance
2. Accuracy
3. Completeness
4. Clarity
5. Logical structure
6. Grammar and language
7. Audience suitability
8. Tone and style
9. Originality
10. Professional presentation

Calculate the total score out of 50.

Then provide:

- Overall assessment
- Three major strengths
- Three areas for improvement
- Whether the content is ready for final submission

Do not rewrite the content.

Output

A quality score and final evaluation.

9. Detailed GenAI Workflow

10. Input and Output Flow

Step	Input	Processing	Output
1. Requirements	User idea	Requirement analysis	Content specification
2. Outline	Requirements	Content planning	Structured outline
3. First Draft	Requirements + outline	Content generation	First draft
4. Review	First draft	AI editing	Corrections
5. Finalize	Draft + corrections	Content refinement	Final content
6. Evaluation	Final content	Quality assessment	Score and feedback

11. Example Input

Content Idea:

Create a LinkedIn post explaining how Generative AI is changing software development for college students interested in software engineering.

The workflow can adapt to different types of content such as:

- Articles

- Blog posts
- Social media posts
- Reports
- Product descriptions
- Educational content
- Marketing content
- Professional communications

12. Key Generative AI Concepts Demonstrated

1 Prompt Chaining

The output of one prompt becomes contextual input for the next stage.

2 Task Decomposition

A complex content-generation task is divided into smaller stages.

3 Structured Prompting

Each prompt clearly specifies the role, objective, requirements, constraints, and expected output.

4 Context Management

Previous outputs are used to maintain consistency throughout the workflow.

5 Iterative Refinement

The first draft is reviewed and improved instead of immediately treating it as the final answer.

6 AI-Based Quality Control

A dedicated review stage checks the content for weaknesses and potential problems.

7 Evaluation

The final content is evaluated against predefined quality criteria.

8 Conditional Workflow

The workflow can return to the improvement stage when quality issues are detected.

13. Advantages of the Workflow

1. **Improved content quality** – Multiple stages allow the content to be refined.
2. **Better consistency** – Requirements and outline are carried throughout the workflow.
3. **Audience awareness** – Content is generated according to the intended audience.
4. **Reduced errors** – A dedicated review stage identifies potential problems.
5. **Efficient content creation** – AI handles planning, drafting, editing, and evaluation.

6. **Reusable workflow** – The same workflow can be applied to different content types.
7. **Iterative improvement** – The workflow can repeat generation and review when necessary.
8. **Measurable quality** – The final output receives a defined quality score.

14. Expected Final Result

The workflow produces content that is:

- Relevant to the user's objective
- Appropriate for the target audience
- Well structured
- Clear and professional
- Reviewed for errors
- Refined through multiple stages
- Evaluated using measurable criteria

15. Conclusion

The AI Content Creation and Quality Assurance workflow demonstrates how Generative AI can be used as a structured multi-step process rather than through a single prompt.

The workflow combines requirement analysis, content planning, prompt chaining, generation, AI-based review, iterative refinement, and quality evaluation.

The conditional feedback loops allow the workflow to improve the generated content when quality issues are identified. This makes the workflow more reliable, reusable, and suitable for practical Generative AI applications.
